

Landscape Care Instructions

WATERING NEW SOD

Water area at least once a day in the morning (best time is before sunrise) for approximately 2-3 weeks. Do not water grass after sundown! This keeps grass too wet for too long and could lead to fungus and other issues. After sod is established, decrease watering frequency to encourage the turf to send roots deeper to retrieve their own moisture. WATCH OUT FOR— shaded areas, they may not require as much water. During periods of good rain please adjust your watering. If you have an automatic watering system, it is best to install a rain shut off device to disarm the system when it rains.

Be proactive and walk your lawn weekly- looking around for trouble areas i.e. dry spots and saturated areas. Resolve irrigation problems to minimize harm to the turf.

Once Maintenance commences on lawn make sure it is cut at 3.5"-4.5". The higher the better- helps to retain moisture, keep roots deep, and the lawn thick to keep weeds out.

A chemical company is highly recommended to help maintain the stability of the turf. Pre-emergence, fungicides, micro nutrients, and other chemicals that are needed for best results.

Plant watering instructions:

1 Gallon Plants – Water every day for 2-3 weeks (1 gallon per plant, approximately 15 seconds per plant)

3 Gallon Plants – Water every day for 2-3 weeks (3 gallons per plant, approximately 30 seconds per plan)

5 - 7 Gallon Plants – Water every day for 2-3 weeks (5 gallons per plant, approximately 45 seconds per plant)

Additional Notes:

- 1. You can do this! Be confident with that hose!
- 2. Disregard any rainfall unless it exceeds two inches at your location.
- 3. Always monitor soil moisture by feeling the soil under the plant or tree
- 4. The above directions should be followed for approximately 2 months; after that period, the plants will have sufficient water from proper irrigation. (Supplemental watering during dry periods may need to continue indefinitely)
- 5. Watering should be focused at the base of the plant. Wetting the foliage does not benefit the plant and can promote disease.
- 6. When possible, water in the morning or in the evening to minimize evaporation.

ATTENTION CUSTOMERS – SOD and other vegetation (plants ect.) IS NOT GUARANTEED
